

A silver coin for CERN

The Swiss Federal Mint issues a limited-edition silver coin in honour of CERN

(Image: Swissmint)

On 13 March 2025, Swissmint issued a special "CERN" coin symbolising Swiss and global innovation.

Swissmint is the company mandated by the Swiss Confederation to mint Switzerland's standard coins, the ones you use for everyday payments. It also produces special-edition coins to mark important historical and cultural events or to honour eminent Swiss personalities or organisations.

The special, limited-edition CERN coin is made of silver and weighs 20 grams. A particle collision is depicted on the "heads" side (known as "obverse" in numismatic jargon), while the "tails" (or "reverse") side depicts the cross-section of an LHC magnet.

The coin is worth 20 Swiss francs and is on sale on Swissmint's website.

A luxury "burnished flan" version will be presented at the International Coin Fair in Bern in mid-May and will then go on sale in a display box at the [CERN shop](#).

More information can be found on the [Swissmint](#) and the [Swiss Government](#) websites.

Accelerator Report: Recommissioning on track as the first beams progress through the complex

The recommissioning of the accelerators is progressing according to schedule. Unsurprisingly, some issues have arisen, but they have been swiftly addressed by equipment experts. First physics in the PS East Area and n_TOF is scheduled to start next week

In [my previous report](#), I wrote that the first beam injection of 2025 into the PS Booster (PSB) was scheduled for 27 February. However, injection ultimately took place ahead of schedule, at around 11.30 a.m. on 26 February.

Following this, the standalone beam commissioning period for the PSB began. During this phase, the PSB team focused on commissioning the beam within the PSB, without needing to deliver it to downstream machines or experiment areas. This phase concluded with the first beam delivery to the PS at noon on 4 March, also one day ahead of schedule. With this, the PSB standalone commissioning ended, and PS standalone commissioning began.

It is important to note that the conclusion of PSB standalone commissioning does not mean that all its operational beams have been fully recommissioned. The commissioning of the various beam types required by the downstream machines and experiment areas will continue in parallel. These beams will be transferred into the PS at a later stage for further commissioning.

The standalone commissioning of the PS is set to conclude on 14 March, when the SPS is scheduled to receive its first beam of 2025.

Meanwhile, the SPS hardware commissioning has been progressing well, with magnets around the machine undergoing testing by pulsing them to high magnetic fields. On 10 March, while pulsing the magnets, SPS operators detected abnormal vacuum behaviour in sextant 6 of the machine. Under normal conditions, the vacuum pressure in the SPS chamber is around 1×10^{-8} mbar. However, when the magnets in sextant 6 were pulsed, the pressure increased tenfold, suggesting a small leak in the vacuum chamber that seems to

open when the magnets are pulsing to high magnetic fields.

In the coming days, further diagnostics and leak testing will be carried out to pinpoint the exact location of the leak. Similar situations have occurred in the past and were typically resolved by replacing the affected magnet and its vacuum chamber with a spare unit. This exchange, including vacuum pumping after installation, usually takes about 24 hours and is not expected to impact the scheduled delivery of beam for physics to the SPS North Area on 14 April.

The signals of two vacuum pressure sensors in sextant 6 of the SPS. On the left-hand side, the normal vacuum pressure is visible and rather flat. Just before 5.00 p.m. on 10 March, the magnets were pulsed and the pressure increased. When the pulsing of the magnets is interrupted, the vacuum pressure recovers somewhat. (Image: CERN)

The year-end technical stop (YETS) activities in the LHC tunnel are also nearing completion, and the machine should be “handed over” from the Engineering department to the Operations group on 13 March. Following this, hardware recommissioning and testing will take place in preparation for the first beam injection, which is planned for 4 April.

Rende Steerenberg

Prime Minister of Italy visits CERN

Giorgia Meloni (left), Prime Minister of Italy, and CERN Director-General, Fabiola Gianotti, in the LHC tunnel on 7 March 2025. (Image: CERN)

On 7 March, CERN welcomed Her Excellency Ms Giorgia Meloni, President of the Council of Ministers of the Italian Republic. The Prime Minister and her delegation visited Point 1 of the LHC alongside CERN's Director-General, Fabiola Gianotti; the Director for Finance and Human

Resources, Raphaël Bello; the Director for Research and Computing, Joachim Mnich; the Director for International Relations, Charlotte Warakaulle; senior Italian physicist and President of the TERA Foundation, Ugo Amaldi; the Head of the Theoretical Physics department, Gian Giudice; the Head of the Information Technology department, Enrica Porcari; the Italian spokesperson of the LHCb collaboration, Vincenzo Vagnoni; the Italian former department Head in charge of the Management liaison for Italy, Roberto Losito and the President of INFN, Antonio Zoccoli.

Following an introduction to CERN's activities by the Director-General, the delegation then visited, accompanied by Ludovico Pontecorvo from the ATLAS collaboration, the ATLAS control room and experiment cavern, as well as the LHC tunnel. They also had the opportunity to discover CERN Science Gateway's exhibitions.

Steering ATLAS forward with new management

Spokesperson Stéphane Willocq and Deputy Spokespersons Anna Sfyrla and Guillaume Unal will lead the collaboration for the next two years

From left to right: Technical Coordinator Martin Aleksa (CERN), Deputy Spokespersons Guillaume Unal (CERN) and Anna Sfyrla (University of Geneva), Upgrade Coordinator Benedetto Gorini (CERN), Spokesperson Stéphane Willocq (University of Massachusetts Amherst), and Resources Coordinator David Francis (CERN). (Image: CERN)

The [ATLAS](#) collaboration welcomes its new management team, who began their mandate in

March 2025. Succeeding Andreas Hoecker as ATLAS Spokesperson is Stéphane Willocq (University of Massachusetts Amherst). A long-standing ATLAS member since 2004, he brings extensive leadership experience to the role, having previously served as Deputy Spokesperson, ATLAS Physics Coordinator and Chair of the Publications Committee. Joining him in the new management team are Deputy Spokespersons Anna Sfyrla (University of Geneva) and Guillaume Unal (CERN), alongside returning members Technical Coordinator Martin Aleksa (CERN), Resources Coordinator David Francis (CERN) and Upgrade Coordinator Benedetto Gorini (CERN). The new team, who have been elected for a two-year term, will steer ATLAS through the final phase of LHC Run 3 and navigate the transition into the [High-Luminosity LHC](#) (HL-LHC) era. This is a pivotal moment for ATLAS as the collaboration

prepares for extensive upgrades to the experiment.

“I want to express my deep gratitude to Andreas for his leadership and dedication to ATLAS,” says Willocq. “During his two terms as Spokesperson and two preceding terms as Deputy Spokesperson, he played a key role in advancing our scientific programme and strengthening our collaboration. We are building on a solid foundation thanks to his efforts. I also want to extend my appreciation to Manuella Vincter for her six years as Deputy Spokesperson. Her commitment to ATLAS and its members has been invaluable.”

“The strength of ATLAS lies in its people,” Willocq continues. “Our collaboration spans the globe, bringing together individuals from diverse backgrounds and areas of expertise to tackle some of the most profound questions in nature. As we set course for the HL-LHC era, we can do so with confidence, knowing that our collective efforts have consistently driven major scientific advances.”

For more information, including detailed biographies, [visit the ATLAS website](#).

ATLAS celebrates its 2024 thesis award winners

The 2024 ATLAS Thesis Award ceremony. From left to right: ATLAS Spokesperson Andreas Hoecker; ATLAS Thesis Award winners Christian Appelt, Shalini Epari, Kaito Sugizaki, Ana Luisa Moreira de Carvalho, Martino Tanasini, Makayla Vessella and Emily Ann Smith; ATLAS Thesis Awards Committee Chair Jean-François Arguin; and ATLAS Collaboration Board Chair Maria Jose Costa. Not pictured: ATLAS Thesis Award winner Aric Tate. (Image: K. Anthony/CERN)

Congratulations to the winners of the 2024 [ATLAS thesis awards](#). Every year, these awards celebrate the outstanding achievements made by PhD students working with the collaboration, recognising the significant impact of their research on physics analyses, detector advancements and software development.

“The ATLAS Thesis Awards not only recognise the dedication and excellence of our early-career researchers but also underscore the critical role they play in advancing the experiment’s scientific mission,” said Jean-François Arguin, Chair of the 2024 Thesis Awards Committee. “This year’s

submissions were of an exceptional standard, reflecting the depth and breadth of research within ATLAS.”

Explore the winning theses:

- Christian Appelt (Humboldt University): [Extending the limits in the hunt for long-lived heavy neutral leptons with the ATLAS experiment at the Large Hadron Collider at CERN](#)
- Ana Luisa Carvalho (Universidade de Lisboa): [Measurements of Higgs boson properties in associated production with top quarks with the ATLAS detector](#)
- Shalini Epari (Universitat Autònoma de Barcelona): [What to expect when you are expecting new physics: searches for new phenomena in multilepton final states with the ATLAS detector](#)
- Emily Ann Smith (University of Chicago): [A Global View of Jets with the ATLAS Detector: From Hardware Triggers to Precision Measurements and Beyond](#)
- Kaito Sugizaki (University of Tokyo): [Search for higgsinos with compressed mass spectra in final states with low-momentum leptons using 140 fb⁻¹ of proton-proton collisions at 13 TeV](#)
- Martino Tanasini (Università di Genova): [The Higgs, the Beauty and the Charm: Improving Jet Flavour-Tagging and Higgs Boson](#)

[Measurements with Graph Neural Networks in the ATLAS Experiment at the LHC](#)

- Aric Tate (University of Illinois at Urbana-Champaign): [Investigations of Initial State Effects in p+Pb Collisions via Dijet Measurement with the ATLAS Detector](#)
- Makayla Vessella (University of Massachusetts Amherst): [Do Dibosons](#)

[Dream of Semileptonic Sheep? Searching for heavy Wh resonances and optimizing track reconstruction with the ATLAS detector](#)

This year's award ceremony took place on 20 February in CERN's Main Auditorium. More details can be found on the [ATLAS collaboration website](#).

ATLAS collaboration

Arts at CERN collaborates with Tabakalera and DIPC on the exhibition “Quantum Visions”

The exhibition, held in San Sebastián, Spain, invites eleven artists, including former CERN artists-in-residence, to explore the quantum realm

The principles of quantum physics extend beyond the subatomic world and have vastly shaped contemporary culture. Over the last decade, [Arts at CERN](#) has been at the forefront of facilitating this dialogue, welcoming artists to the Laboratory to engage with the complexities and broader implications of quantum theory.

To mark the [International Year of Quantum Science and Technology](#), Arts at CERN has joined forces with [Tabakalera](#) and the [Donostia International Physics Center](#) (DIPC) to present the exhibition [Quantum Visions](#). Hosted at Tabakalera in San Sebastián, Spain, the exhibition features the work of eleven artists, who explore the quantum realm through a kaleidoscope of perspectives and media.

Curated by Mónica Bello, former Head of Arts at CERN, *Quantum Visions* integrates the Laboratory's research into contemporary culture and fosters public engagement with science through artistic expression. Drawing on experimentation, analogy and speculation, the artists' works question the limits of knowledge and propose alternative ways of experiencing the world.

The exhibition features new works by former CERN artists-in-residence, alongside those of other internationally acclaimed artists. Alice Bucknell's *Small Void* (2025), a “call-and-response” video game conceived in dialogue with CERN theoretical physicists, invites players to explore the limits of language, attachment theory

and cosmic annihilation. To build the game's world, Bucknell collaborated with CERN's Mechanical and Materials Engineering group, using nano-scanning techniques to integrate the paradoxical nature of lichens.

Joan Heemskerk presents two new works from her CERN residency. *Entangled binary network (Hello, world!)* (2024) is a foam–UV-light installation speculating on a quantum internet network connecting two entangled fields. In the video work *NO MATTER* (2024), Heemskerk applies mathematical transformations to visualisations of particle events and integrates interviews with scientists in the speculative search for “no matter”.

Filmmaker Jaione Camborda, winner of the 2023 San Sebastián Film Festival's Golden Shell, unveils *Ensayo fílmico sobre la sordoceguera (Filmic essay on deafblindness, 2025)*, an Arts at CERN commission. In this video installation, the projection remains inaccessible, its content unknowable. By challenging the screen's function as a receptive surface, Camborda creates a tension between perception and speculation, drawing viewers into a field of possibilities to imagine what remains hidden.

Quantum Visions also features works by former Arts at CERN residents Nicole L'Huillier, the artist duo Semiconductor, and Yunchul Kim, as well as renowned artists Abelardo Gil-Fournier, Adriana Knouf, Libby Heaney, Marina Rosenfeld and Yuri Pattison.

Computer Security: Store your data right

What chaos! A cacophony of data everywhere you look! Today, if asked where you store your professional documents and data at CERN, you might give any number of answers: AFS, [CDS](#), Ceph, [CERNBox](#), [DFS](#), [EDMS](#), eFiles (“Alfresco”), EOS, [GitLab](#), [Indico](#), your personal computer, a dedicated webpage, an external hard disk, somewhere else... You can imagine how hard it is to control all this data and to properly secure and protect it against unauthorised access, abuse or theft. Particularly if you are dealing with confidential data that must not be disclosed to any third party.

So, let us help you. Based on the Data Classification Policy, the Legal Service, the Computer Security team and stakeholders from the FAP and IT departments have produced a [Data Handling Policy](#) (DHP) setting out how all CERN professional data must be handled. The ultimate responsibility for handling any kind of (digital) institutional data is shared: CERN IT services (the “data processors”) will explicitly declare which type of data they can process, handle and store. You – as the “data controller” introducing data to CERN – can consult their declaration, tag your data according to the classification policy, and enter your data only into IT services that are aligned with that particular level of classification.

How does this work in detail? All CERN IT services have been asked to assess their compatibility with this new Data Handling Policy. Are they physically protecting data? Do they have access-control measures in place in order to guarantee the principle of least privilege? Is data encrypted in rest and in transit? Do they have procedures for properly destroying any media that have held data (in line with [CERN’s Data Destruction Rules](#))? What about other services they rely on? Based on their assessment, and as per the minimum requirements set for each classification level, they

must declare that classification level. In addition, AFS, CDS, Ceph, CERNBox, DFS, EDMS, eFiles (“Alfresco”), EOS, GitLab, Indico and all the others must clearly inform you what kind of data they can handle for you, whether it complies with the most restrictive classification level they support, i.e. “classified data” including personal sensitive data, financial data, etc., “restricted data” visible only on a need-to-know basis, data which is internal to CERN, or just public data. You need to be sure that their declaration matches your expectations before you introduce data into their service*. Just check the corresponding service description in the [CERN Service Catalogue](#) (to come).

The IT storage group and the Computer Security team have already performed a very first assessment of [CERNBox](#) and its underlying storage system based on EOS. Data stored on CERNBox/EOS, like any other data handled by the central IT services, is physically protected by the premises of the CERN Data Centre and subject to tight access controls. Individual data stored on CERNBox/EOS is access-protected using e-groups and individual CERN computing accounts, meaning that your password is required to grant access (or not). Any transfer between CERNBox and a remote client is encrypted using the most recent, up-to-date encryption standard, i.e. TLS-over-HTTP. And, finally, the physical media storing CERNBox/EOS data, i.e. the SSDs and hard disks, have for years been subject to CERN’s Data Destruction Policy, and all such media are properly wiped before leaving the CERN Data Centre for donation, sale or destruction. Hence, following this assessment and in line with the rules set out by the Data Handling Policy, CERNBox has been declared to be capable of storing any type of data, including that labelled as “classified”. In addition, CERNBox provides all necessary means to receive sensitive data from external third parties in a secure, protected and

confidential manner (see our dedicated Bulletin article [“A “file drop” for confidential data”](#)).

While further assessments of the IT services are under way, and while more and more declarations will appear in the Service Catalogue during the year, you can already make a start. Think about where you store all your data. Consolidate your data if possible. And remember that you are a “data processor”, too: your PC and laptop also store data. If they happen to store data labelled as “classified” – which they usually do (think of your passwords or mailbox!) – then make sure that you are compliant with the Data Handling Policy:

- Don’t leave your computer unattended unless it is located in a trusted environment (your office, at home) or properly locked away;
- Encrypt your local hard disk (see here for instructions for [Windows](#), [MacOS](#), [Linux](#) and, e.g., [Ubuntu](#) or call the [ServiceDesk](#) for assistance);

- Protect access to your computer using a good password (some recommendations can be found [here](#));
- Protection should also include locking your screen when you leave your computer unattended; and
- Once you need to get rid of your computer, ensure that your local data is destroyed. Instructions are given in [CERN’s Data Destruction Policy](#).

While we will try to help you, we also appreciate your help to properly protect CERN’s professional data!

** In fact, given the cacophony mentioned earlier, quite some work will be needed to relocate all the data that has in the past been put into the “wrong” service. We are counting on you to help clean up that mess!*

Computer Security Office

Official News

Members of the personnel shall be deemed to have taken note of official news published for the CERN community. Reproduction of all or part of this information by persons or institutions external to the Organization requires the prior approval of the CERN Management. The full list of official news is available here: <https://cern.ch/official-news>.

CERN Health Insurance Scheme (CHIS) – Temporary relocation of UNIQA office to Building 55

Please note that the UNIQA office, currently located in the Main Building on the Meyrin site, will be **temporarily moving to Building 55** at Entrance B. The UNIQA office will be **exceptionally closed on 7 April** due to the move.

The UNIQA office will be in Building 55 from **8 April 2025** until the end of the refurbishment in the Main Building expected in October 2025.

Parking at Entrance B is limited to 30 minutes and there is an accessibility parking place available.

The UNIQA letterbox in the Main Building will be closed during the relocation but one will be installed in Building 55 and one can also be found on the ground floor in building 33 – CERN Community Support Centre (CCSC). It is also possible to send documents to UNIQA by internal mail.

HR department

Simplified procedure for taking leave in the event of the death of a family member

Losing a loved one is always difficult, and the administrative formalities should be as simple and supportive as possible during such times. Since obtaining a death certificate can be complicated in some countries, or it can feel uncomfortable to request one, you will no longer be systematically required to do so. Instead, you can now simply complete the “Death of a family member” declaration available in the Admin e-guide and send it to your departmental or group secretariat so that your leave can be registered in EDH.

Leave in the event of the death of a family member

In accordance with article R II 4.28 of the Staff Rules and Regulations, members of the personnel (employed and associated) are entitled to paid leave of:

- 3 working days for the death of a spouse/partner, child or parent
- 1 working day for the death of a sibling, parent-in-law or step-parent

This leave may be split up but cannot be taken more than thirty calendar days before or after the death.

In addition to leave, staff members meeting the criteria for the award of the international indemnity, fellows and graduates may be entitled to the payment of expenses relating to “travel for family reasons” (Articles R V 1.15 and 1.15 bis of the Staff Rules). The payment of such expenses is also subject to the submission of the “Death of a family member” declaration.

Cases requiring a death certificate

If you are a member of the CERN Health Insurance Scheme (CHIS) or of the CERN Pension Fund, please note that, in the event of the death of your spouse/partner or dependent child, you will still need to submit an official death certificate, issued by the relevant registry office, in order to access certain benefits or entitlements.

Next blood donation campaign on 25 March

Contribute to this essential act of solidarity that benefits us all

At the last blood donation campaign on 26 November 2024, 108 donors came along to give blood, of which 34 were first-timers. 88 donations were collected. Thank you to all donors!

The Geneva [blood barometer](#), which is regularly updated, shows that blood stocks continue to run extremely low. CERN is a key contributor to blood stocks in the region and ranks 2nd as the region's biggest blood donor after the *Hôpitaux universitaires de Genève* ([HUG](#)).

To maintain this momentum, CERN will hold its first blood donation session of 2025 on Tuesday 25 March, from 8.30 a.m. to 4.30 p.m. in collaboration with the HUG in [Building 29](#).

Two further blood donation campaigns will be organised this year, on 22 and 23 July and 18 November.

Before coming to the Building 29 donation point, please make sure that:

- you are in good health and have no symptoms such as fever, cough, a cold or breathing difficulties;
- You are eligible to give blood:
 - Complete the brief online [pre-donation questionnaire](#) (in French)
 - Please consult this [information sheet](#) and this [questionnaire](#) issued by the HUG.

- Note that only the pre-donation conversation with the nurse or doctor on the day can confirm your eligibility).
- If returning from travel abroad or arriving from another country, perform the [travelcheck](#) on the HUG website (in French)
- If you have recently been vaccinated against the flu or COVID, ensure 48 hours have passed since receiving the vaccination.
- Please bring proof of ID with you on the day of the donation.

Save yourself time: pre-book your appointment with OneDoc:

The possibility of pre-booking your appointment via the OneDoc platform is made available on this [link](#). Spontaneous donors will be able to come at their convenience without an appointment, mindful that there may be some waiting time on the day.

As a thank you, the HUG will be giving each donor a 10 CHF voucher, to be used in Novae's Restaurants 1 and 2 at CERN.

We hope to see many of you at the donation point!
[Give blood, save lives.](#)

HSE unit

Be LS3 ready: plan your safety training now!

The poster is titled "LS3 is approaching... Le LS3 approche..." and asks "Are you trained and ready? Êtes-vous formé(e) et prêt(e) ?". It features three cartoon characters in safety gear. The first character is talking to a supervisor, with text: "DISCUSS Safety training needs with your supervisor" and "DISCUTEZ vos besoins en formation de Sécurité avec votre superviseur". The second character is looking at a catalogue, with text: "CHECK OUT the catalogue and verify the validity of your courses" and "CONSULTEZ le catalogue et vérifiez la validité de vos cours". The third character is holding a sign that says "SIGN UP! NOW" and "INSCRIVEZ-VOUS !". There is a QR code next to the third character. At the bottom, it says "Anticipate your Safety training needs NOW to avoid last minute bottlenecks" and "Anticipez dès MAINTENANT vos besoins en formation de Sécurité pour éviter les engorgements de dernière minute". It also includes contact information: "Need help? Have questions? Contact: Besoin d'aide ? Des Questions ? Contactez : safety-training@cern.ch" and logos for "Safety Always Sécurité toujours" and "HSE Occupational Health & Safety and Environmental Protection unit".

Long Shutdown 3 (LS3) is approaching. During long shutdowns, the number of people doing

classroom safety courses goes up by as much as 40%.

To make sure that you can access the installations when the time comes and are fully prepared from the safety point of view, you should start to think about your training needs right now.

LS3 is also a strategic time to boost your skills and acquire new knowledge.

Don't delay!

- Talk to your supervisor to determine which safety training courses will be required for your tasks during LS3.

- [Take a look at the training catalogue and check that your previous safety training is still valid](#) on the CERN [Learning Hub](#).

- Enrol **now** for the relevant classroom courses!

Planning your safety training needs in advance will help you avoid long waiting lists for safety courses and guarantee you a place on the right course before you need to request access to a specific installation.

If no session is scheduled or the available dates are inconvenient, put your name on the waiting list. This will also help us to establish the demand and organise new sessions accordingly.

Please feel free to contact us if you have any questions.

Thank you for planning ahead.

The Safety Training service
(safety.training@cern.ch)

How to better manage stress day to day

Discover CERN's new stress check-up programme

Stress is a natural part of life, but when it starts affecting your sleep, concentration or energy levels, it's time to take action. Whether you're facing a fast-paced work environment, growing responsibilities or personal challenges, managing stress effectively is key to maintaining well-being and performance.

To help you to better understand and manage stress, CERN's Medical Service is launching a Stress Check-up programme with three practical components:

1. Group Stress Check-up workshops – A 1.5-hour interactive session combining awareness and practical tools to help you to identify stress triggers, understand their impact and discover a simple and effective strategy to

manage stress.

Sign up now (max. 12 participants):

- [Wednesday, 26 March](#), 2.00 p.m. to 3.30 p.m.
- [Tuesday, 13 May](#), 10.30 a.m. to 12.00 p.m.
- [Tuesday, 24 June](#), 10.00 a.m. to 11.30 a.m.

2. Individual Stress Check-up assessments – An individual, personalised assessment, in complete confidentiality, designed to measure your stress and energy levels on a physiological level and provide tailored recommendations for better stress management.
3. For supervisors: on-site prevention actions – Every team is unique: we can provide tailored sessions designed to help each team member to acquire the concrete tools they need to identify, understand and reduce stress and conserve their energy.

Take action for your well-being! Equip yourself with effective strategies to reduce stress and improve resilience: join us for a group workshop or contact us at infirmery-service@cern.ch to arrange an individual check-up or a team session. For more information and resources, see <https://hse.cern/mentalhealth>.

Georges Vianès sadly passed away on 4 February, at the age of 86. From 1989 to 1991, during the mandate of Director-General Carlo Rubbia, he was the Head of Administration at CERN and a member of the Directorate.

He was formally appointed to the role during the 86th session of the CERN Council in December 1988, in the light of his already extensive experience.

He received his law degree in 1960 and went on to obtain a diploma from the *Institut d'études politiques de Paris* in 1961 and a postgraduate diploma in economic sciences in 1962. He trained at the *École nationale d'administration* (ENA) from 1965 to 1967, before joining the *Cour des Comptes* as an auditor in 1967 to audit and regulate public funding and accounting within France.

From 1971 to 1975, he was deputy director of the *Agence nationale de valorisation de la recherche* (ANVAR), which promoted technology transfer between French research institutions and industry. Later, from 1975 to 1982, he was the director of the *Institut national de la propriété industrielle* (INPI). He helped to create the European Patent Organisation (EPO) in 1977 and was appointed Chairman of its Board of until 1981. He was also Chief Executive Officer of the French bank *Banque Worms* from 1982 to 1984. From 1985, he was Director-General of Regional Development and the Industrial and Technological Environment in the French Ministry of Industry and Research, prior to his role at CERN.

During his three-year appointment in the CERN Directorate, starting in 1989, he implemented a number of reorganisations of CERN's administration. Former colleagues remember fondly his straightforward, uncompromising and honest character, which was greatly appreciated by all.

Following his time at CERN, he went on to become mayor of the French commune of Ferney-Voltaire from 1995 to 2001. During his time as mayor, he was instrumental in the purchase of the *Château de Voltaire* by the State in 1999. He returned to the *Cour des Comptes* in 1994 and had a long career there until his retirement in 2007.

In the course of his career, he was awarded many honours, including *Chevalier de la Légion d'honneur*, *Officier de l'ordre national du Mérite* and *Chevalier de l'ordre du Mérite agricole*.

CERN extends its sincere condolences to the family and friends of Georges Vianès.
